

Food independence using the EW-MFA

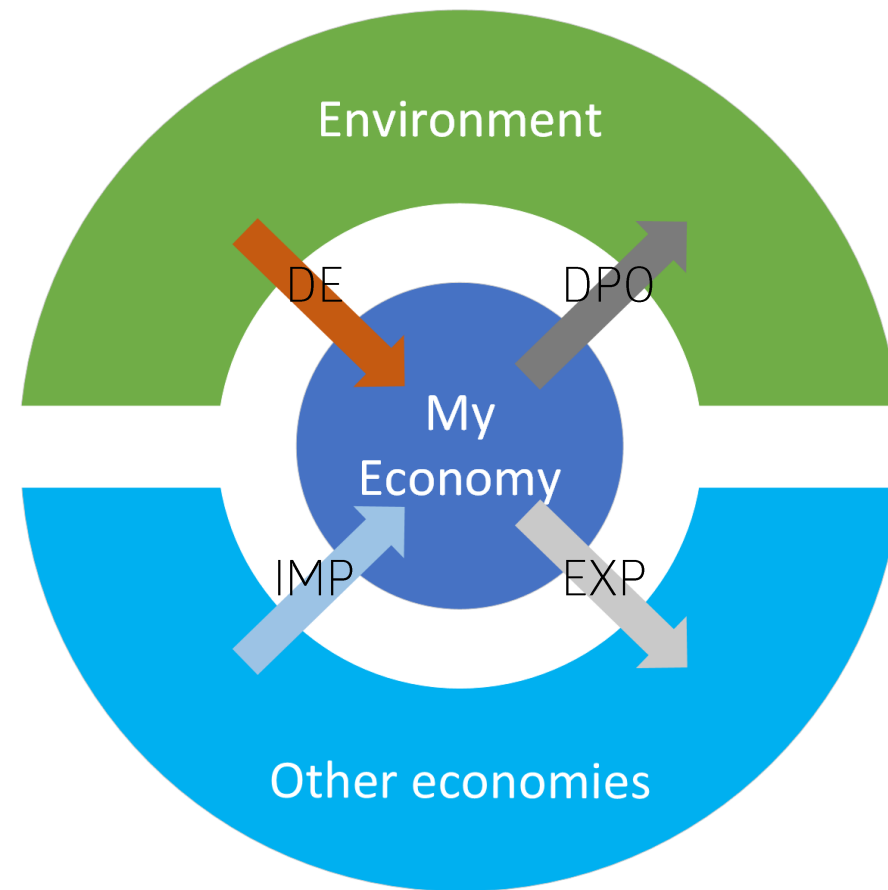

Þorsteinn Aðalsteinsson

The reason for this project

1. Annoyance with shortcoming of the Economy-Wide Material Flow Account (EW-MFA)
2. Curiosity about food issues
3. Gobs'n'gobs of information at my nerdy fingertips

The Economy-Wide Material Flow Account

Domestic Extraction

Import

Non-metals

Energy materials

Metals

Biomass

Other

Export

No... E...

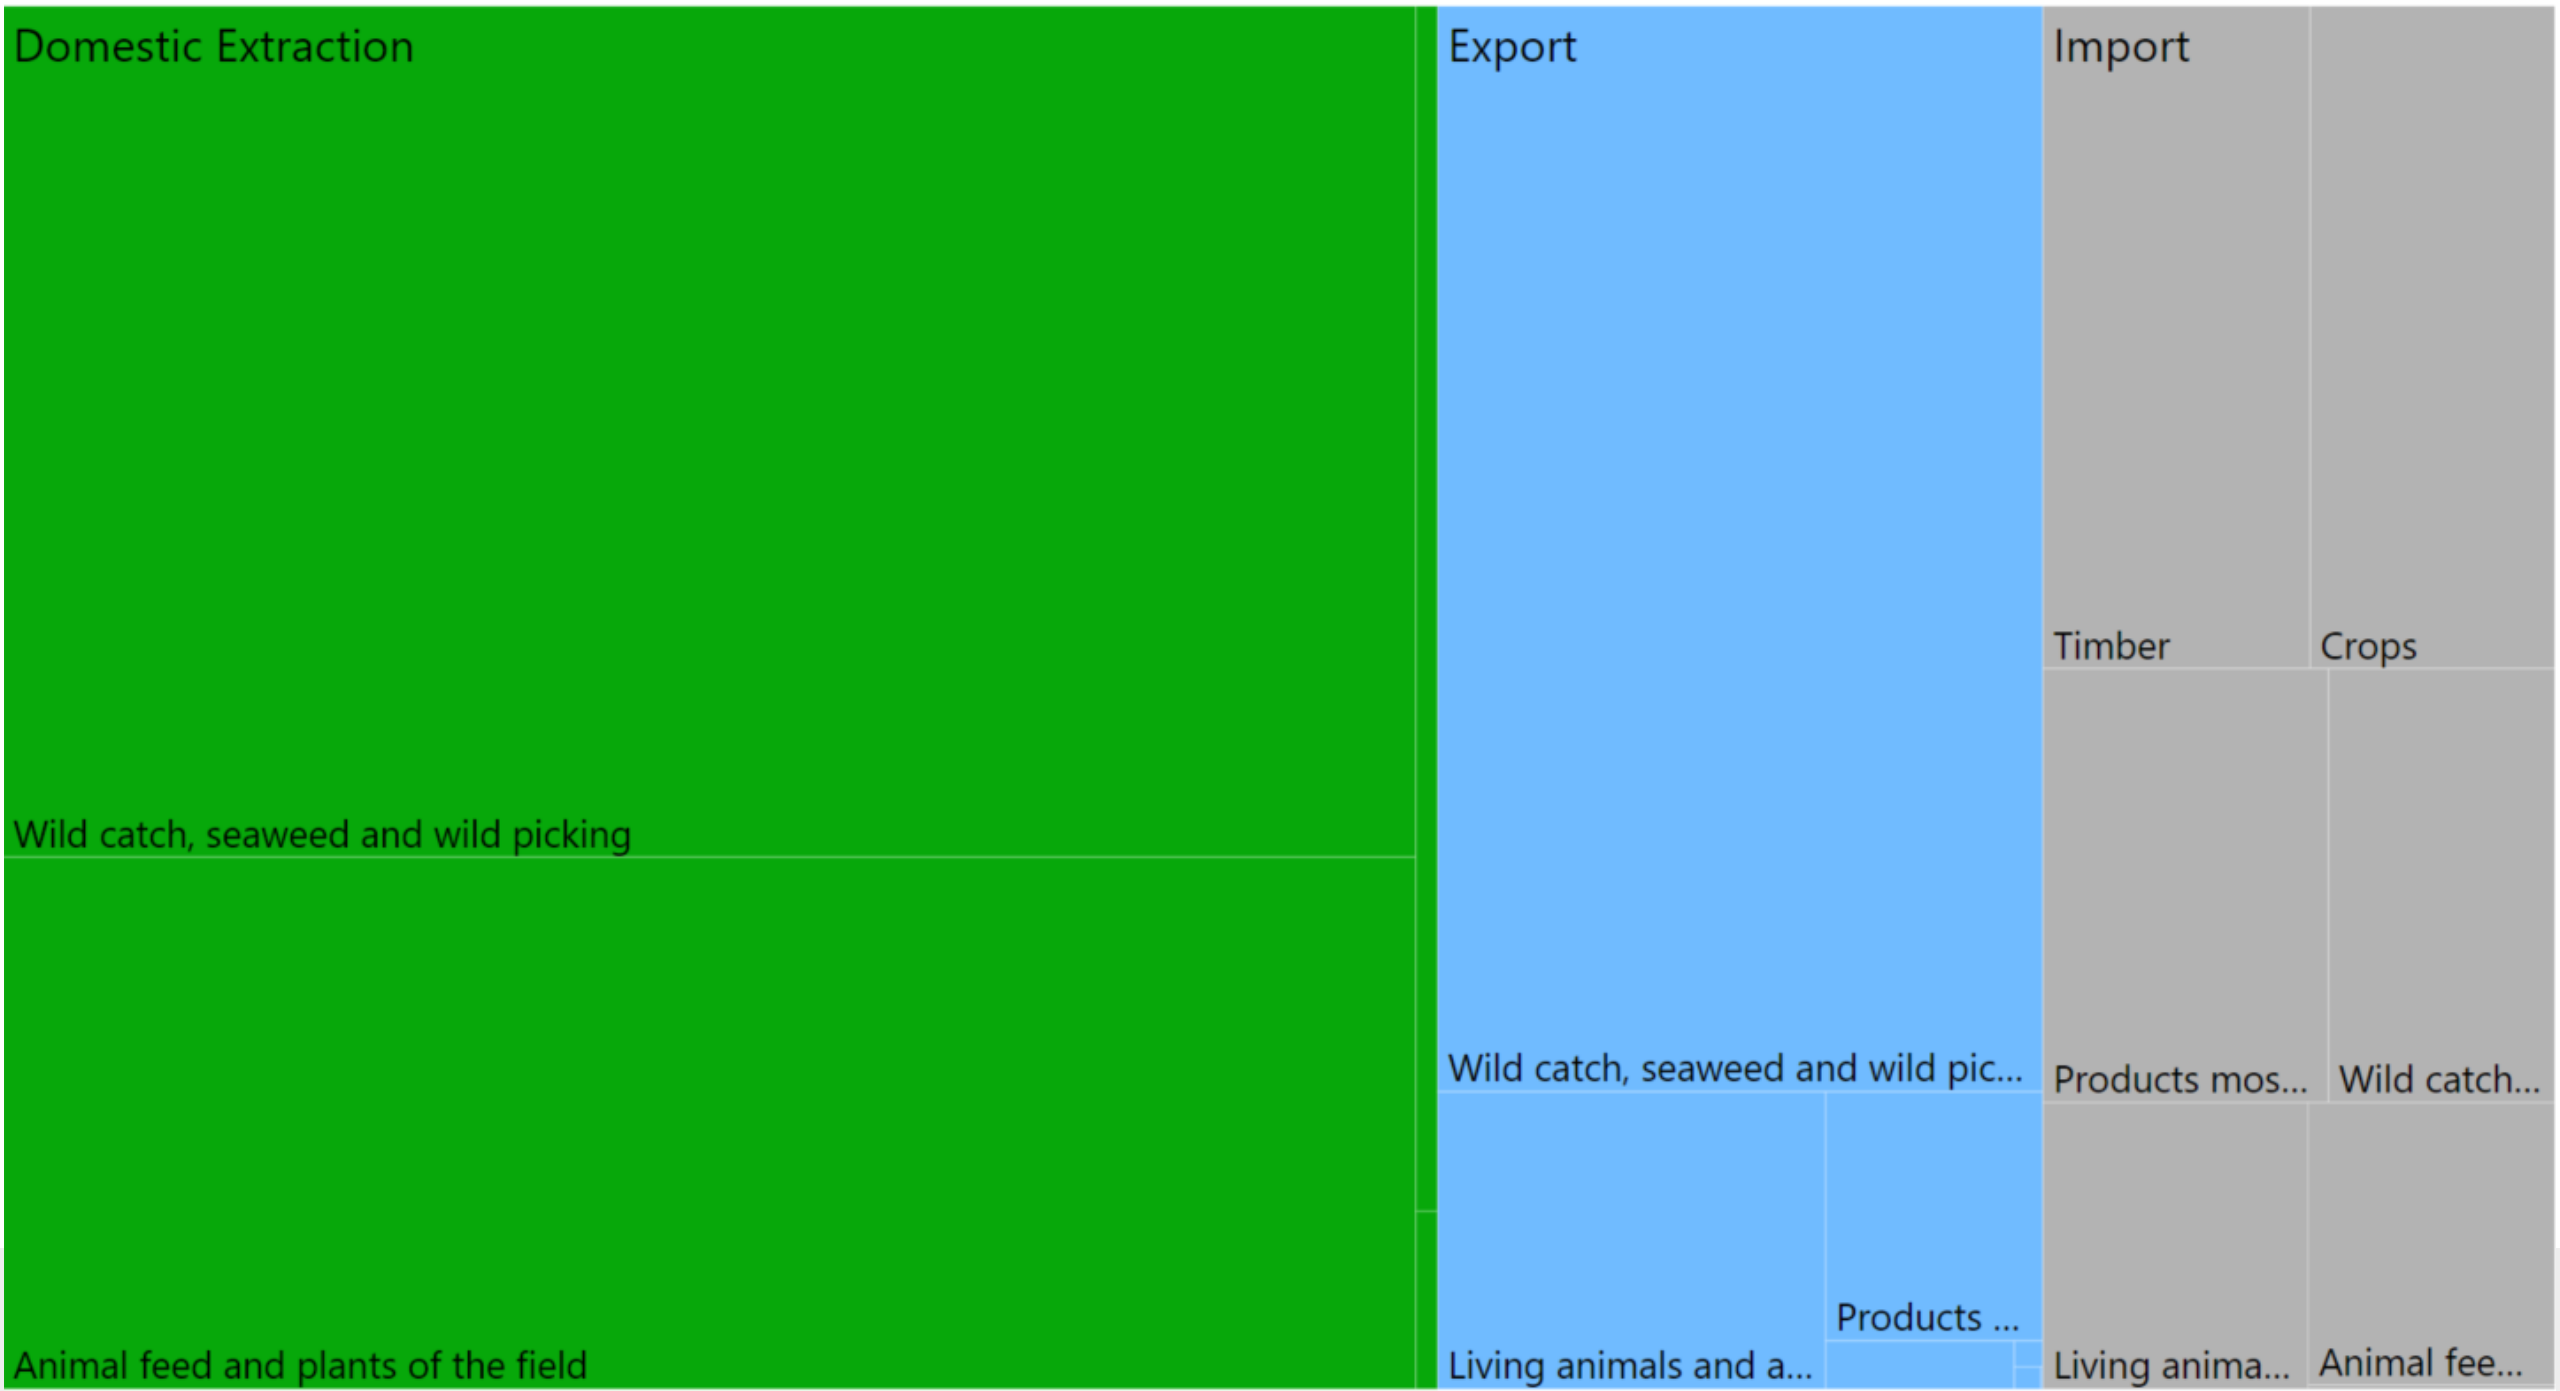

Non-metals

Biomass

Biomass

Metals

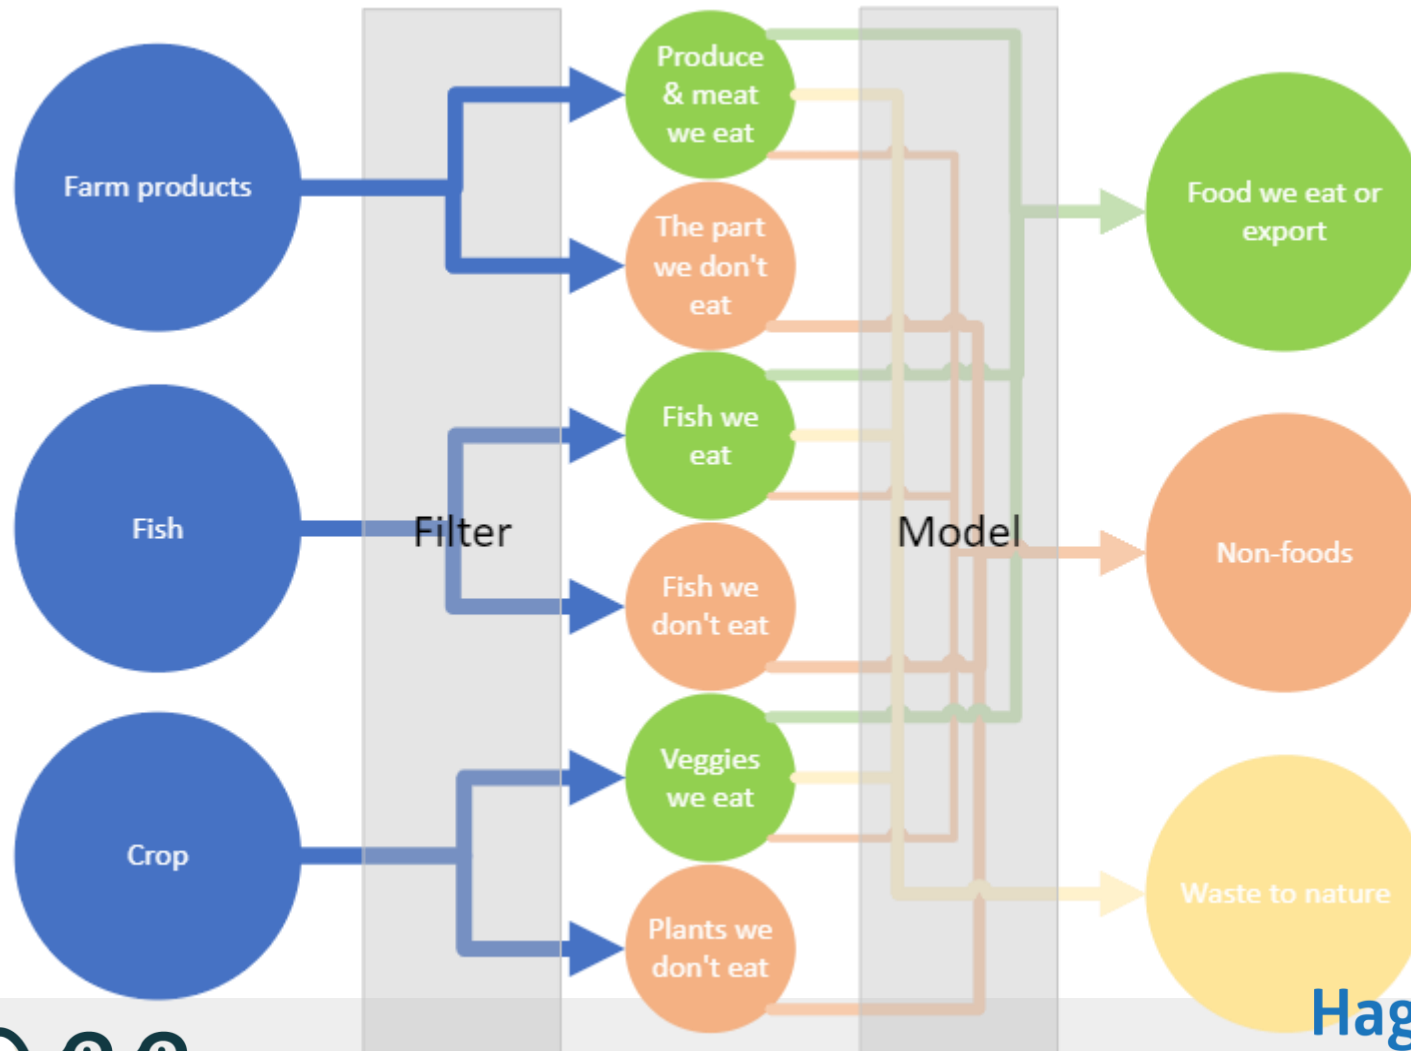

Other ...

The task

- Isolate the flow of food in and out of the economy

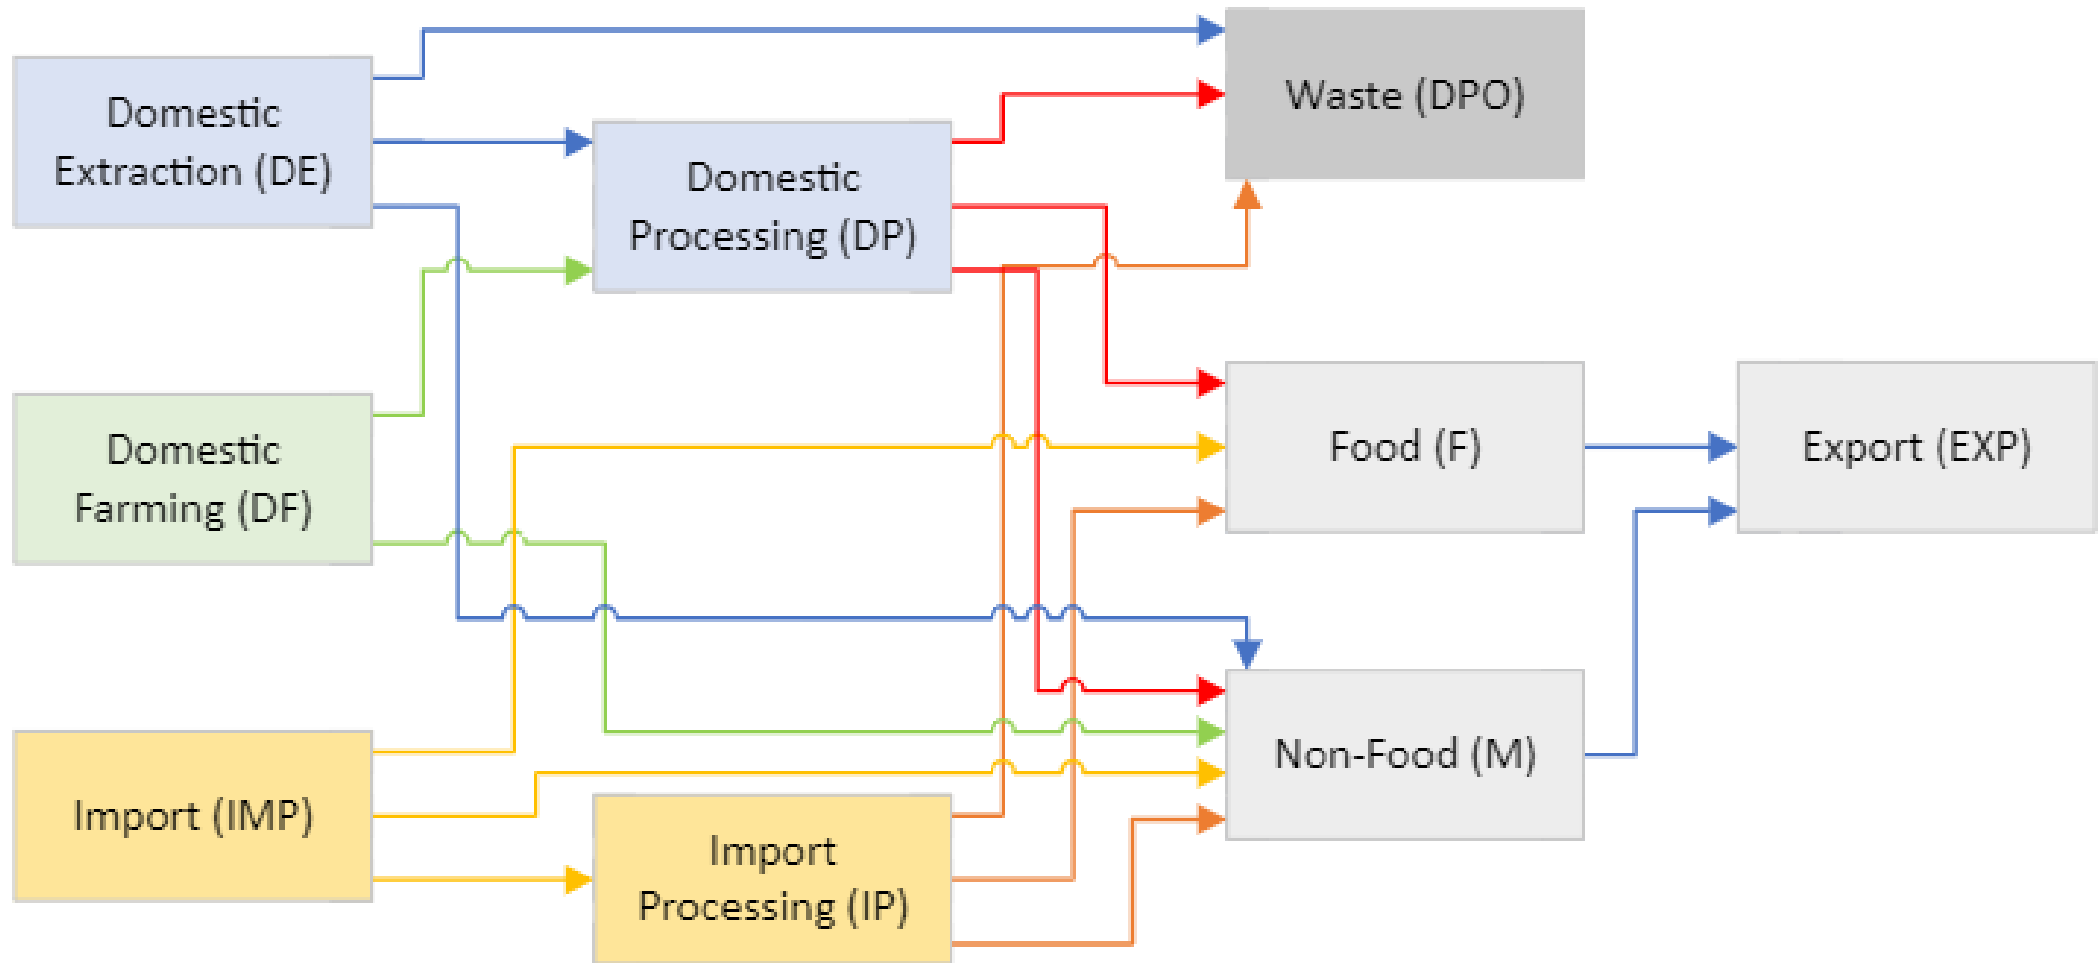

Approaching the buffet

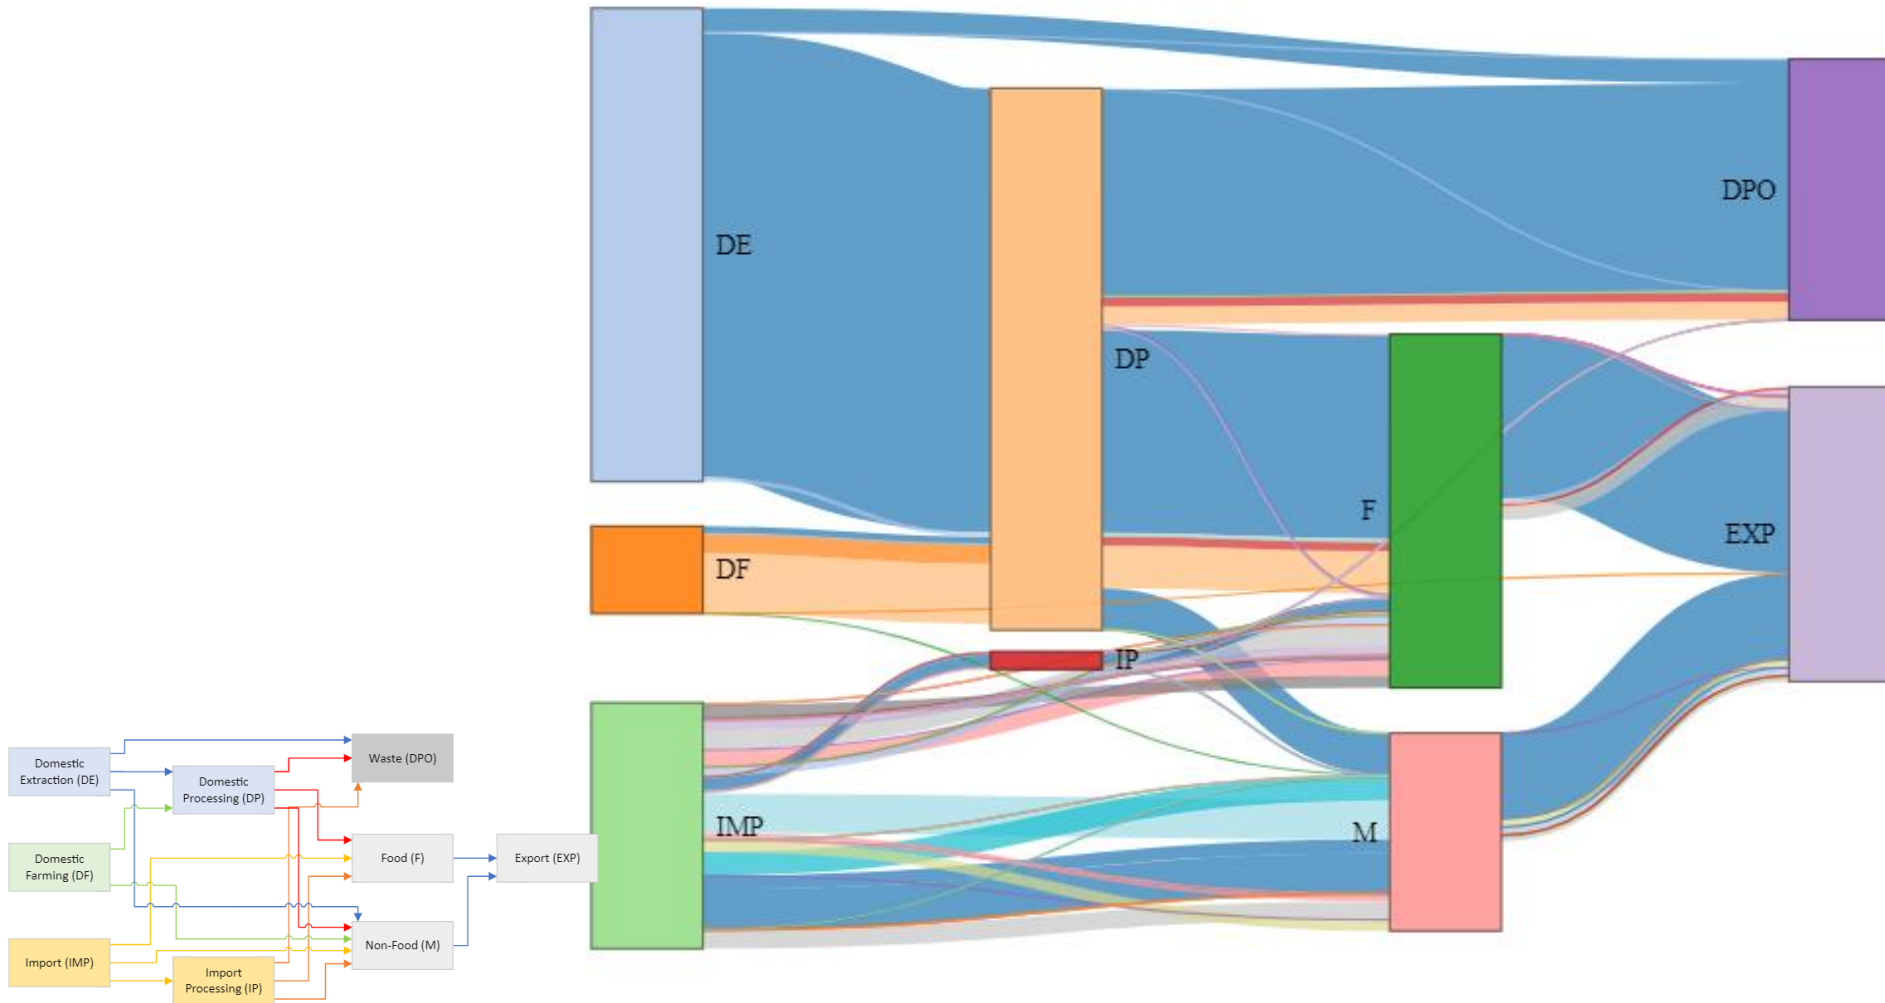

Modeling approach

- Less is more
 - Use the registry information I have access to
 - Assume European-ish food tradition (none of that „kúttmagi“ stuff)
 - Assume „best case“ behavior of yield from material (using Matís/MAST handbooks)

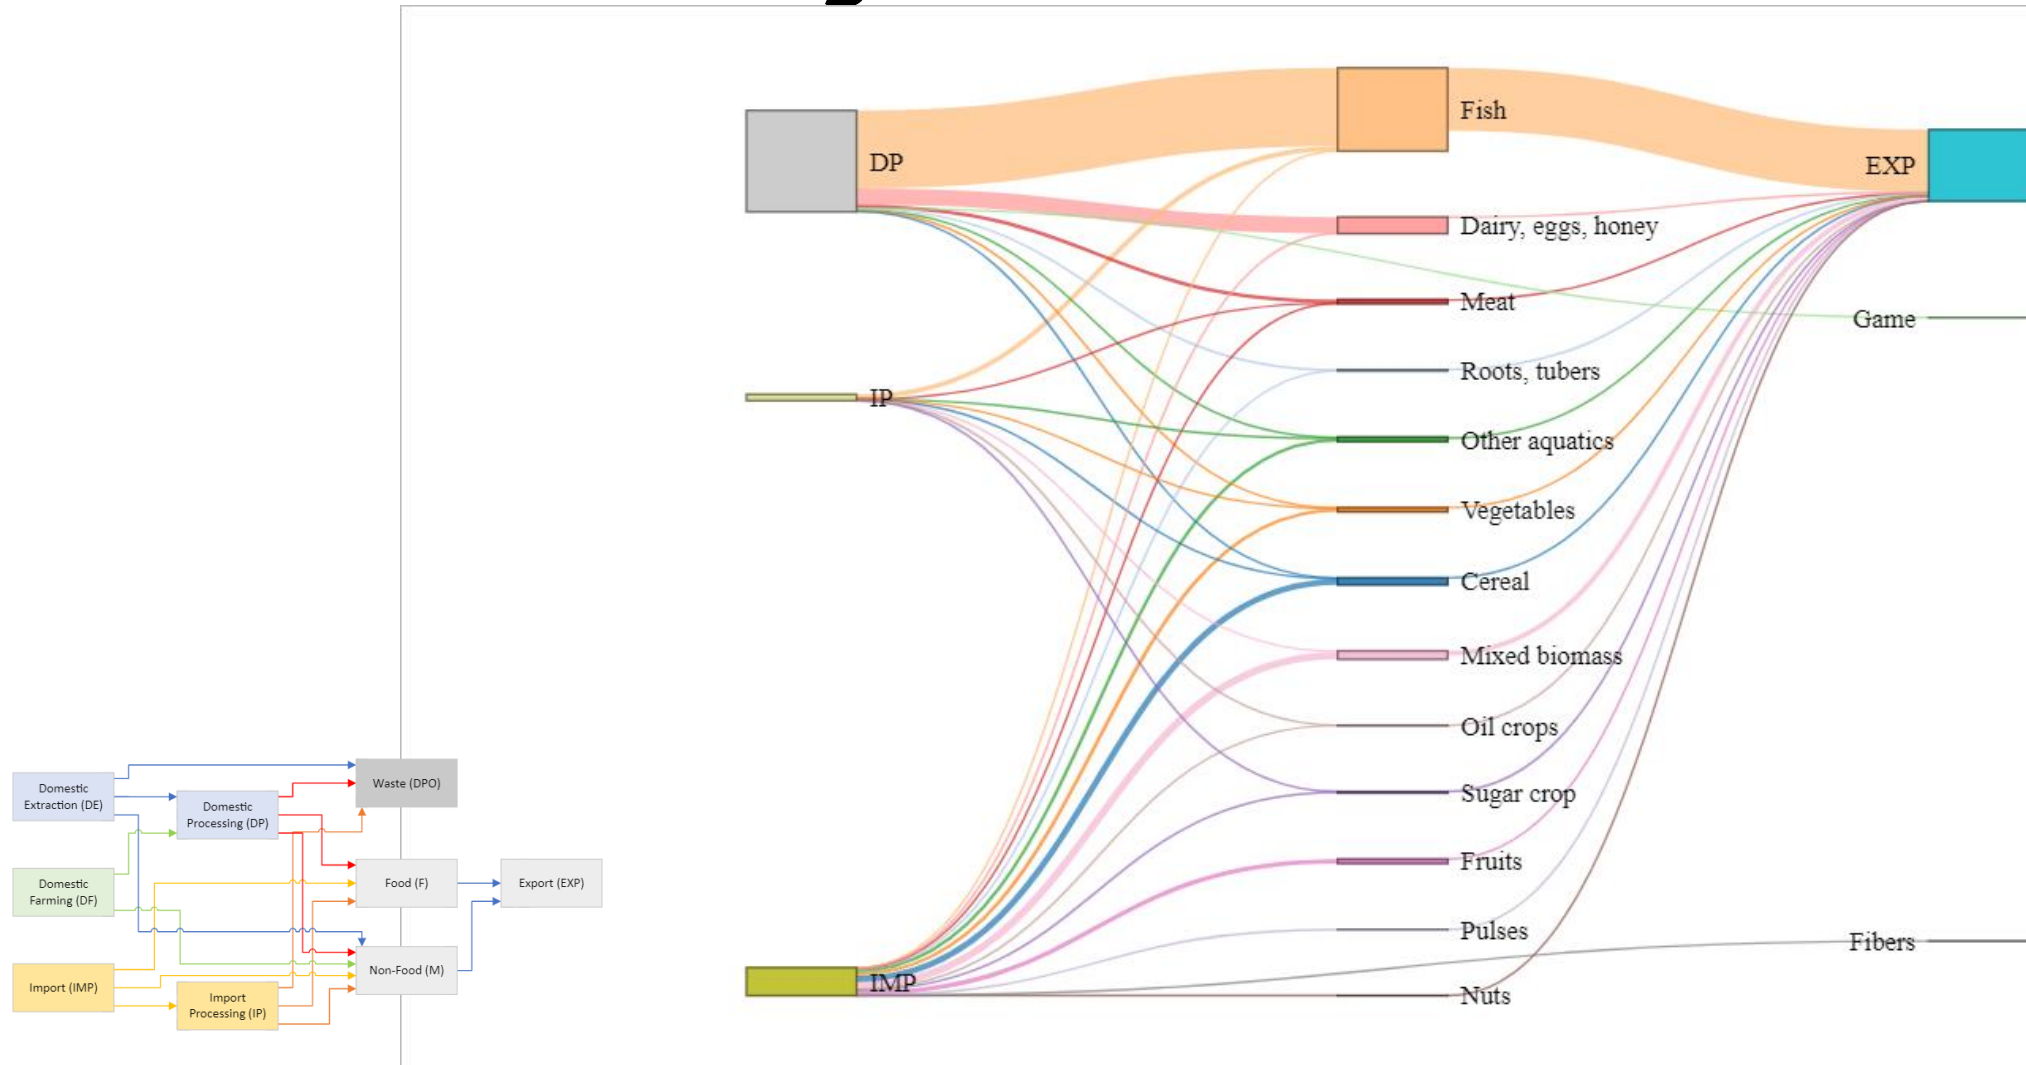

The output structure

Biomaterials

Food availability

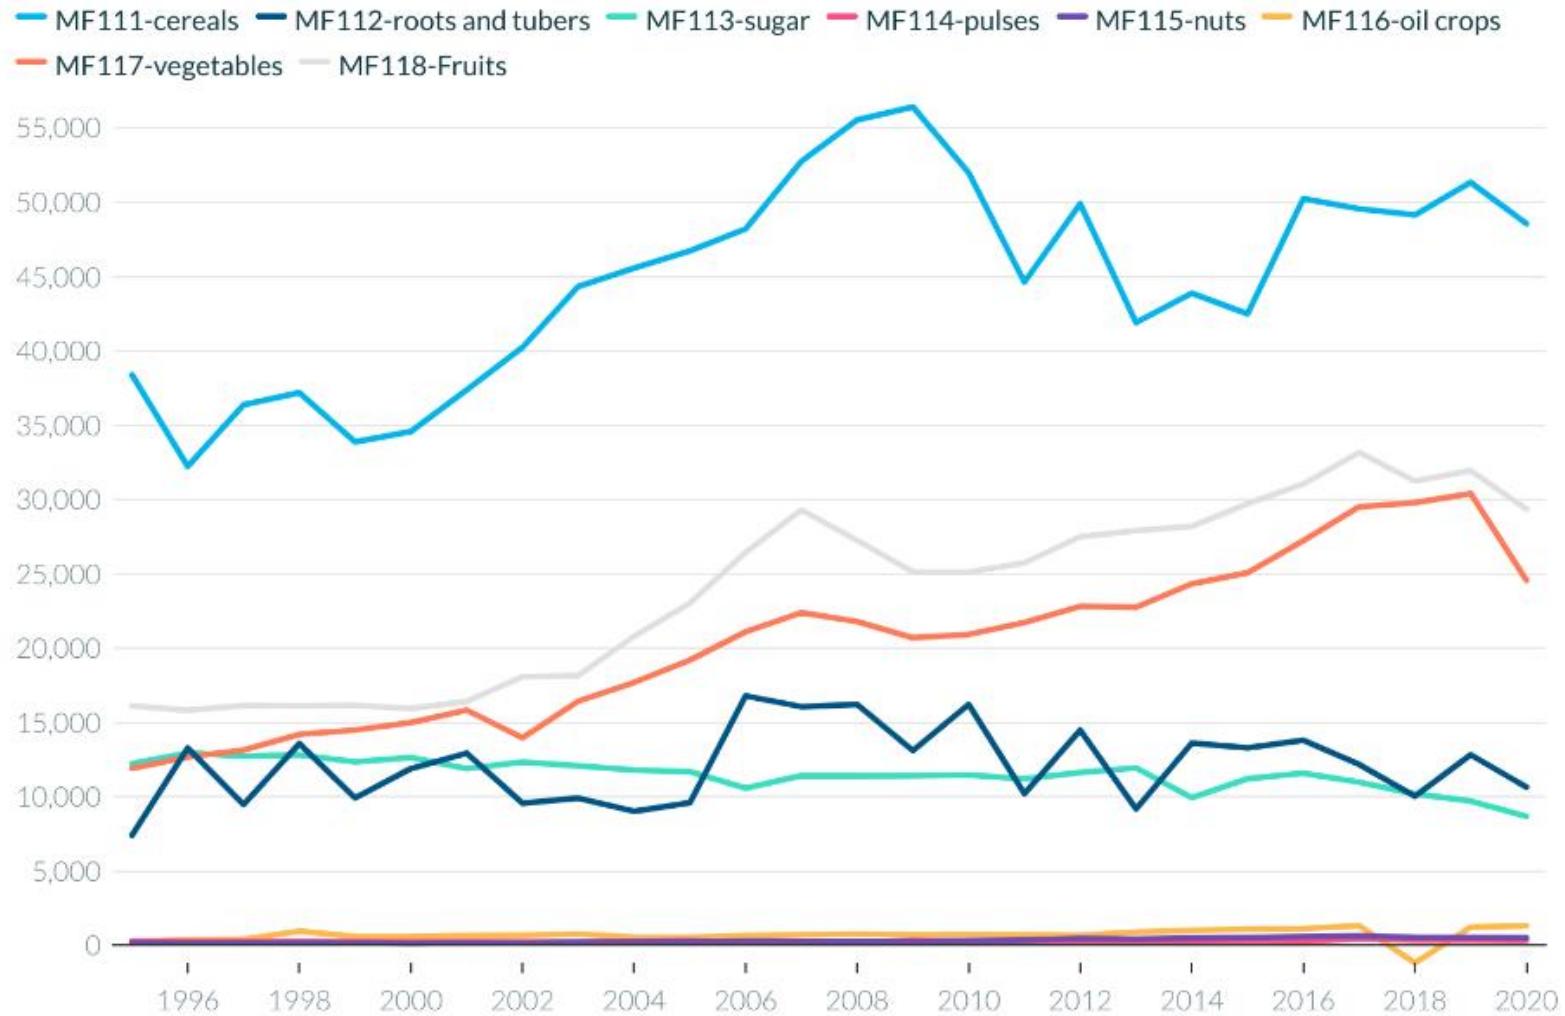

Measure of food availability

$$FA = [m(DP \rightarrow F) + m^{\circ}(IMP \rightarrow F)] - m(F \rightarrow EXP)$$

$$m^{\circ}(IMP) = m(IMP \rightarrow F) + m(IP \rightarrow F)$$

Crops food available

tons

Animal products available

tons

MF141-fish MF142-other aquatic animals MF143 - hunting and gathering MF152 - meat
MF153 - dairy, eggs and honey MF16

Food independence measure

$$\gamma = \frac{m(DP \rightarrow F) - m(F \rightarrow EXP)}{[m(DP \rightarrow F) + m^{\circ}(IMP \rightarrow F)]}$$

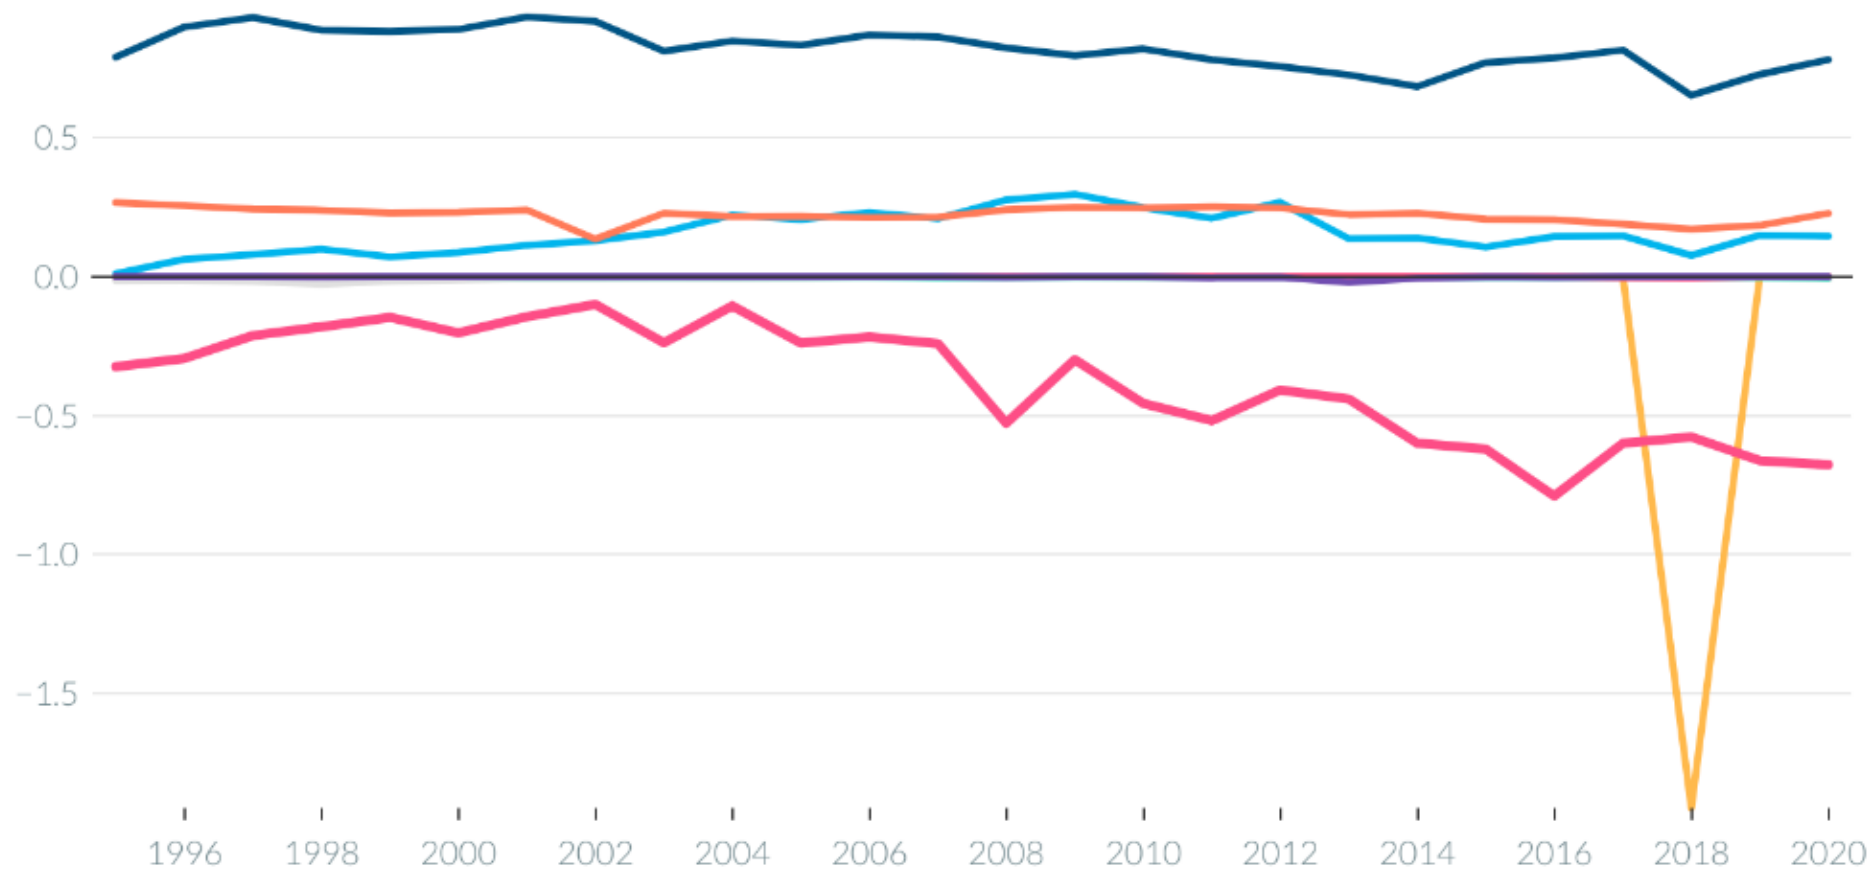

$$m^{\circ}(IMP) = m(IMP \rightarrow F) + m(IP \rightarrow F)$$

Food independence for Crops

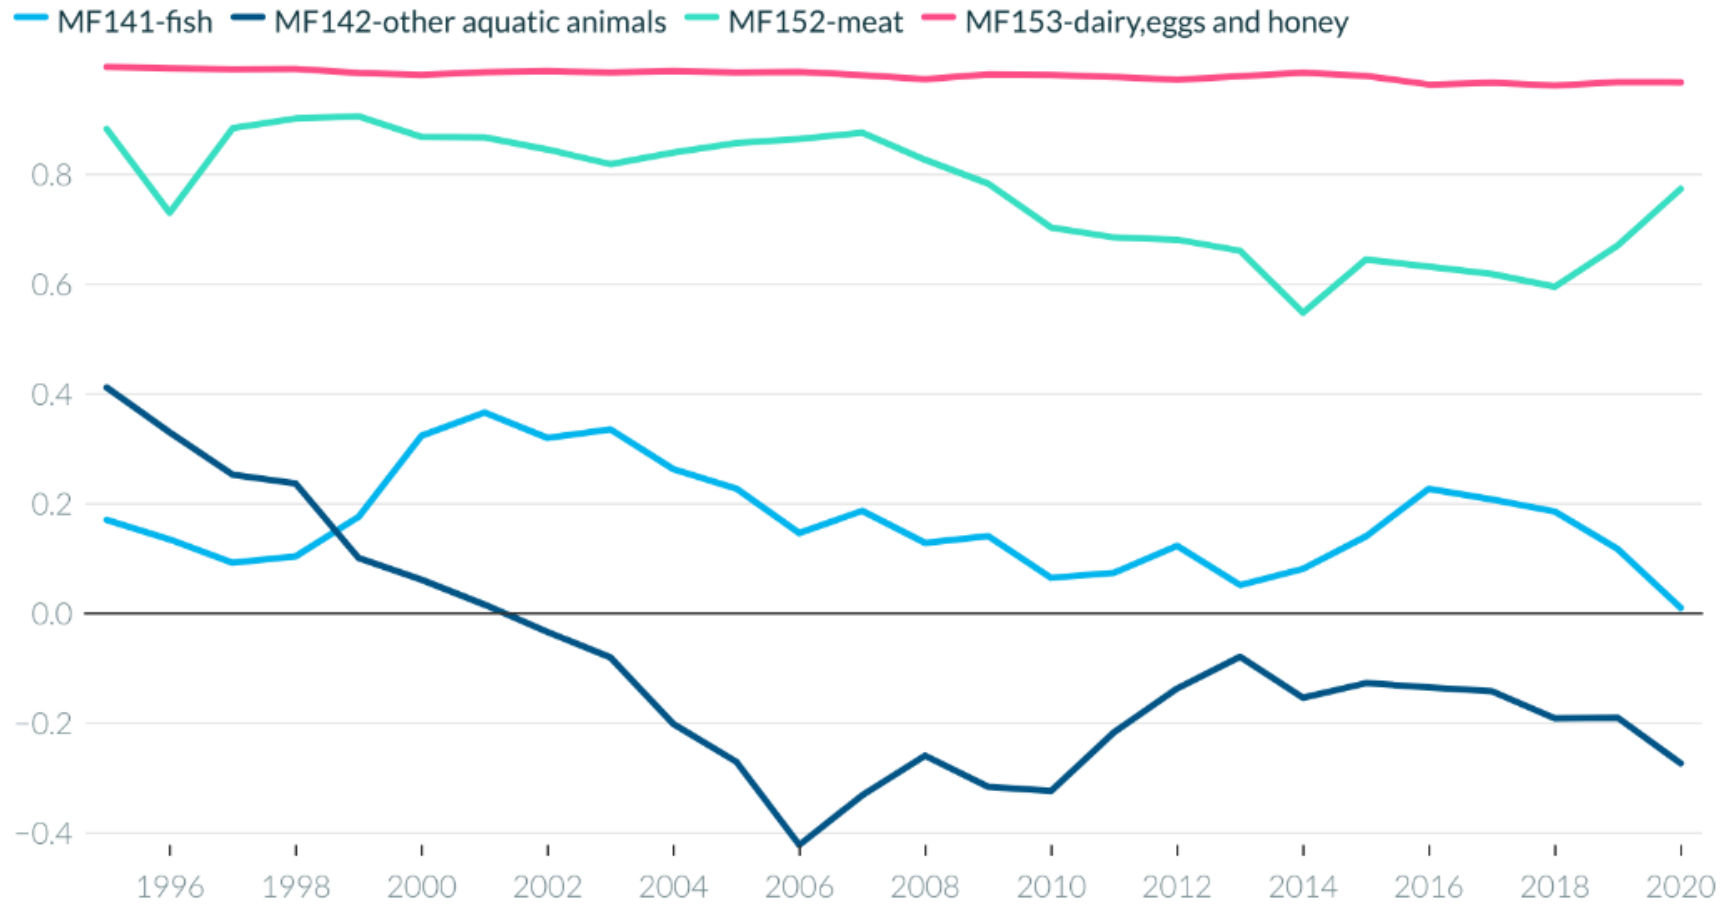

tons

MF111-cereals MF112-roots and tubers MF113-sugars MF114-pulses MF115-nuts MF116-oil crops
MF117-vegetables MF118-fruit MF16-other

Food independence for meats

tons

To summarise

- Is this method and „enrichment“ of the EW-MFA data viable &|| transferable?
 - Do I believe the outcome?
- This is a „simple“ method to get a measure on food offering
 - What the heck is wrong with the fish?
 - How do I estimate MF.1.6 - other? (or do I)

Thank you!
